# Mount Cluster Storage Locally

1. Create a local mount point:

```
mkdir ~/clustermount
```

2. Mount the cluster directory you need:

```
sshfs username@gateway.hpc.tu-berlin.de:  clustermount/
```

A path can be given after `:`. None uses the users home directory.

3. Your cluster home is now available at ~/clustermount

4. To unmount close all open files in ~/clustermount and leave the directory in the shell or your file manager. Then umount:

```
fusermount -u ~/clustermount
```
